STATE ESTIMATES OF CASH FARM INCOME AND GOVERNMENT PAYMENTS
BY MONTHS, JANUARY 1936 TO DECEMBER 1939

May 1940

In the preparation of the calendar-year estimates of cash farm income, 1936 to 1939, by States 1/, and the monthly estimates of cash farm income for the United States, 1936 to 1939 2/, the income from each of the farm products from each State was estimated by months. These estimates of income have been summarized in the accompanying tables, which show the income from crops, from livestock and livestock products, and from Government payments by States and by months from January 1936 to December 1939. These estimates provide a comparison with the monthly estimates of cash farm income by States which are published currently in the Farm Income Situation reports. As the historic revisions of farm income estimates now in progress are completed, the monthly estimates of income by States will be extended back to January 1924. The method of computing these earlier estimates will be similar to the method used in preparing the estimates for 1936-39, which is discussed in the following pages.

In preparing a general revision of farm-income estimates during the past 3 years, many additional data on marketings and prices of farm products have been compiled. These data not only provide a more reliable measure of monthly income for the commodities previously used in estimating receipts from the sale of principal farm products by States, but also make it possible to estimate monthly income from several additional commodities and provide a basis for estimating the total cash income from farm marketings monthly by States. Receipts of farm products at the principal markets, carlot shipments by State of origin, State production data, the trend of marketings in past years, and monthly prices received by farmers, provide the principal sources of information for the current estimates of income by States. The current estimates are subject to revision at the end of the marketing year as more detailed information becomes available on total sales during the crop year and on the monthly distribution of sales in the various States.

The income from the minor crops, and from those products for which no monthly data on marketings or prices received by farmers are available is estimated currently on the basis of the relationship which prevailed from 1936 to 1939 between the income from those products for which income is estimated currently and the income from all farm products. With more data available on monthly marketings and prices, the commodities for which income is estimated currently account for 95 percent or more of the total cash income in nearly all States. The basic data available for distributing marketings by months during the period 1936 to 1939 and estimating current marketings by States monthly are discussed in the following pages.

1/ Cash farm income and Government payments in 1939 are estimated at \$8,518,000,000, Bureau of Agricultural Economics nineographed publication, January 30, 1940.

2/ Monthly estimates of cash farm income and Government payments, 1936 to 1939, Bureau of Agricultural Economics nineographed publication, April 1940.

APR 28 1945

Method of estimating monthly income from grains

At the end of each crop-marketing season information is obtained from crop reporters on the proportion of the preceding year's production of each grain sold. These data, together with the estimates of production, provide a measure of the crop-year sales of the different grains for each State. Information collected from interior mills and elevators on the quantity of grain purchased from farmers each month provides a measure of the proportion of the total sales made each month during the crop year. In a few States, where cash sales of grain are relatively unimportant, the monthly distribution of sales is based on sales of neighboring States.

The estimated quantities sold each month are valued by prices received by farmers as of the 15th of the month to obtain the monthly income from sales. For those commodities on which loans are made by the Commodity Credit Corporation, cash income for the month includes the amount received in loans. Any additional income received later through the redemption and sale of commodities placed under loan is added to income in the month of redemption.

The current estimates of cash income from grains are computed by estimating the United States quantities sold during the month from the average percentage sold in past years and from market receipts in the important producing States. These quantities are distributed by States according to normal sales and indicated marketings in the different regions, and valued by the monthly farm price in each State. In some of the States, where the sales of grain are relatively unimportant and a large part of the sales are marketed locally so that market receipts do not provide a reliable measure of the month-to-month variation in sales, the estimated quantities to be sold during the crop-marketing year are distributed on the basis of the average seasonal movement to market in past years.

Marketings of cotton and cottonseed based on market receipts and ginning reports

The distribution of monthly sales of cotton lint for the 1935-38 seasons is based on data collected directly from crop reporters. Sales from the current crop are estimated from market receipts and the quantity of cotton ginned during the month. Monthly marketings of cottonseed are estimated from the quantity of cotton ginned each month, since the usual practice of farmers is to sell their cottonseed at the time of ginning. During most of the period since 1933 substantial quantities of cotton have been placed under loan, and in many years only a part of the cotton has been redeemed. Furthermore, the part which has been redeemed may have been redeemed in another crop year. Money received from cotton placed under loan is considered income at the time the loan is made. Any additional income obtained through the redemption of loans is credited to the month in which the redemption was made, whether or not the cotton was redeemed in the same crop year in which the loan was made.

Income from tobacco based largely on reports of State departments of agriculture

In the important tobacco-growing States, sales of tobacco and prices received by growers are reported currently to the State departments of

agriculture. These reports provide a measure of the income from tobacco each month in these States. In a few of the minor producing States where similar types of tobacco are grown, the trend of sales and prices is estimated from sales in the neighboring States where records on monthly sales are kept. In the cigar-leaf areas, where tobacco is not sold extensively on auction markets, the estimated crop is distributed by months according to deliveries in past years of tobacco to dealers and manufacturers, as reported by the Bureau of Internal Revenue. These monthly marketings are valued by prices received by farmers, which are reported each month by tobacco dealers in the tobacco-growing areas. At the end of the crop-marketing year, season average prices are obtained from growers of cigar-leaf tobacco, and the monthly estimates of income are adjusted to the value of the crop.

Marketings of fruits and vegetables measured
by carlot shipments

At the end of each crop-marketing year a disposition survey is made to determine the proportion of the potato, sweetpotato, and dry edible bean crops sold and consumed in farm homes. The monthly movement of these commodities to market is measured in part by reports from railroads on the number of cars of these different commodities originating in each State during the month. State statisticians also contact buyers and truckers, and some States have Federal inspection of truck shipments. These data are all considered in estimating the proportion of the crop sold each month.

At the beginning of each crop-marketing season the probable marketings during the crop-marketing year are estimated from the relationship of production to sales in past years. Monthly sales are estimated from current data available on shipments and market receipts, and are distributed to the various States according to the trend of marketings in past years. As a further check on sales in each State, cumulative records of sales are kept during the crop-marketing year and compared with similar records for past years and with the estimated sales from the State during the crop-marketing year. This check keeps the movement from each State in line with the supplies available and with the usual marketing trends.

For the years 1936 through 1939 marketings of commercial truck crops sold for fresh consumption were estimated monthly for each commodity and for each State on the basis of carlot shipments and truck movement, where available, and were valued by monthly prices received by producers. To this value was added the value of each truck crop grown for manufacture, distributed according to monthly sales, to determine the total income from commercial truck crops by months in each State. The sum of the income from the different commercial truck crops grown in each State was used as a basis for distributing the monthly income from all truck crops, which includes sales from market gardens.

A comparison of the monthly distribution of marketings of truck crops by States for the 4 years 1936-39 indicates that the seasonal trend of marketings is fairly regular year after year. An analysis of these 4 years also indicates that the relation of the income between States is fairly regular except for longer-time trends, which are affected by the faster increase in production by some States than by others.

The United States marketings of commercial truck crops are estimated currently from carlot shipments of tomatoes, cabbage, onions, lettuce, celery, cantaloups, and watermelons and are valued by prices received by producers. The United States income from all truck crops is estimated from the relationship of the income from the truck crops mentioned above to the income from all truck crops during the period 1936-39, and is distributed among the States according to the proportion of income received in each month during the years 1936-39, with allowance for the trend of income. In periods of abnormal weather conditions, such as January and February 1940, losses in certain States are allowed for in the distribution of the total income among the various states.

The cash income from fruits and nuts includes citrus fruits (oranges, tangerines, grapefruit, lemons, and limes), apples, peaches, pears, cherries, grapes, strawberries, cranberries, other small fruits (blackberries, blueberries, currants, dewberries, gooseberries, loganberries, raspberries, and other berries exclusive of cranberries and strawberries), other fruits (apricots, avocados, dates, figs, nectarines, olives, persimmons, pineapples, plums, pomegranates, prickly pears, prunes, and quinces, as well as cherries in noncommercial producing States), and tree nuts (almonds, filberts, pecans, and Persian walnuts).

For many of the minor fruits, prices and disposition data are available only at the end of the crop-marketing season. For the period 1936-39, sales during the crop-marketing year were valued by season average prices and the income distributed among different months in each State according to the proportion marketed each month as indicated by carlot shipments. For a few of the minor fruits, the only data available on marketings and income are the reports of the Agricultural Census. The income from these fruits is estimated yearly from the relationship of the income from these fruits in census years to the income from fruits for which estimates can be made annually, and interpolations are made for the intervening years. Consequently, the current estimates of income are subject to revision when new census data become available. However, the amount of income received from those fruits for which income is interpolated is a relatively small proportion of the total.

Current estimates of marketings are made for oranges, grapefruit, lemons, apples, peaches, pears, and strawberries from the relationship of carlot shipments to total sales in past years. The movement of apples during the out-of-storage season is also estimated from the amount of apples moving out of storage each month. The estimated United States quantities of marketings are distributed among the various States on the basis of the movement to market during past years and are valued by average prices received by farmers in each State. The income received each month from the fruits mentioned above was compared with the estimated total income from fruits and nuts by States for the period 1936-39, and this relationship is used in estimating the total income from fruits and nuts currently in each State. These estimates are subject to revision at the end of the crop-marketing season when data on marketings and prices of additional fruits and nuts become available. About 70 percent of the total income from fruits and nuts is received from those fruits for which monthly data are available for estimating income.

Income from sugar crops

The estimates of income from sugar crops include income from sugar beets, sugarcane for sugar, sugarcane sirup, sorghum sirup, maple sugar, and maple sirup. All the sugar crops are marketed relatively soon after harvest, and the only data available on marketings and prices are collected near the end of the crop-marketing year. Since many of the important sugar crops are grown under contract and paid for on specific dates, the income from sugar crops is distributed according to the dates of payment rather than at the time of marketing. Production and price data on sugar beets and sugarcane for sugar are obtained through cooperation with sugar factories, and estimates of production and prices received by farmers are obtained directly from factory reports. Income from the sirup crops and maple sugar is estimated from data received from crop reporters on production and prices, and distributed during the months of the marketing season according to information on time of sale obtained by State statisticians.

The current estimates of marketings of sugar crops are based on estimates of production, and current prices are estimated on the basis of the relationship between prices received by producers and the price of sugar in past years.

Miscellaneous crops

Miscellaneous crops include hay, sweet sorghum for forage, legume and grass seeds, peanuts, hops, broomcorn, popcorn, peppermint, and forest, greenhouse, and nursery products. For the years 1936-39 the estimates of income from each of the miscellaneous crops were distributed by months on the basis of marketings and prices received by producers, the same as for other crops. Current estimates of quantities to be sold during the crop-marketing year for hay, red clover seed, alfalfa seed, timothy seed, soybeans, cowpeas, and peanuts are estimated from the relationship between marketings and production during past years. As no data are available on the current movement of these products to market, the estimated sales during the crop year are distributed by months on the basis of the average movement of these crops to market in past years. These estimated marketings are then valued by monthly prices received by producers.

The month-to-month changes in the United States estimates of income from greenhouse products are estimated from changes in income payments to individuals not on farms, as estimated by the Department of Commerce. Changes in income from nursery products are measured by changes in income payments to individuals not on farms and changes in the volume of residential construction. An allowance is made for income from fruit trees on the basis of the 1929 census, also of sales and yearly estimates of plantings. The estimates of income from greenhouse and nursery products are distributed by States according to the proportion of the income received from these commodities, as indicated by census data for 1929. The estimates of income for other miscellaneous crops for each State are based on the relationship between income from the above-mentioned crops and the income from all miscellaneous crops for the period 1936-39.

Significance of monthly income estimates
from crops by States

It will be noted from the discussion above that the current income from several of the minor crops by States can be estimated only on the basis of changes in income of similar commodities or from changes in the income of consumers. The proportion of such crops in the total income in most States is relatively small, however, amounting to 5 percent or less. In a few of the States, where greenhouse and nursery products are an important source of income, the proportion of the income from these crops amounts to as much as 15 percent. A comparison between the income from these crops and income from the more important crops which can be estimated monthly, for the years 1936-39, indicates that the changes in income are similar. But it is possible that in the current estimates of income the distribution by months and by commodities may be found to be considerably different from the preliminary estimates when data on marketings and prices become available at the end of the crop-marketing year. Consequently, the current estimates of income from crops by States should be used only as an index of the changes in income from these crops and with the understanding that they are subject to revision at the end of the crop-marketing year.

As additional data on marketings and prices of these commodities become available, it will be possible to improve the accuracy of the current estimates of income. However, a comparison of income trends from the different commodities over past years indicates that the method of estimating income from all crops by States is sufficiently reliable to furnish a more accurate measure of the trend of income from month to month than was provided by the estimates on receipts from the sale of principal farm products formerly published by the Bureau of Agricultural Economics.

Method of estimating monthly sales of
meat animals

The annual estimates of sales of meat animals are based upon yearly surveys of the numbers of livestock on farms at the beginning and end of the year, the number of livestock raised, the number slaughtered for home consumption, and death losses during the year. The yearly sales for the United States and by States are distributed by months from monthly reports to the Department of Agriculture on the receipts of livestock at important markets, the inter-State movement of livestock inspected by State Sanitary Boards, and monthly reports on inspected slaughter.

The current United States estimates of the monthly sales of each species of livestock sold are based upon (1) the ratio of inspected slaughter in the current month to slaughter in the same month of the preceding year, (2) the ratio of receipts at principal markets to the same month in the preceding year, and in the case of cattle and lambs from August to December, (3) a ratio between the direct movement into feed lots in the current month and in the same month a year earlier. Although these three ratios tend to move together, they differ somewhat from month to month because of the variation in the amount of livestock going out to feed lots. Each of these ratios is considered in determining the final percentage to be applied to the estimated quantities of livestock sold in the preceding year.

As reports are received on receipts of livestock at the principal markets by State of origin, the ratio is computed for each State between shipments in the current month and shipments in the corresponding month of the preceding year, and applied to sales in the same month of the previous year. The sum of the State estimates of quantities sold is then brought in line with the estimated quantities sold for the United States and is valued by mid-month prices received by farmers in each State.

Income from dairy products

In computing the income from dairy products, the income from butterfat, farm butter, milk sold at wholesale, and milk retailed by farmers is estimated separately. For the period 1936-39 the estimated annual quantities of farm butter and butterfat sold were distributed in each State by months according to the factory production of butter. In a few States, where butter production is very small and fluctuates widely from month to month, the estimated sales for the State were based upon distribution of sales in neighboring States. In the current estimates of income the sales of farm butter and butterfat are estimated from the relationship between factory butter production in the current month and production in the same month of the preceding year.

During the years 1936-39 the estimated annual quantity of milk sold at wholesale was distributed by months from a derived seasonal distribution of milk production based on milk production per cow in the first day of the month, with adjustment for the varying number of days in the month and with allowance for the changing trend in seasonal production in June. In many years the production of milk per cow on July 1 is about as high as in June, but, as the peak of production in most States is reached some time during the month of June, milk production averages higher in June than in July. In States where a large part of the milk is diverted to butter some allowance was made for the greater seasonal variation in the manufacture of butter than in the production of milk.

Beginning with January 1940 the United States estimate of milk sold at wholesale in the current month is based upon a comparison of the production in the current month with the same month in the preceding year, with some allowance for the increased proportion of total milk produced which is being sold at wholesale. These estimates are compared with the estimates of the total production of milk after deducting the estimated amount of milk sold at retail, consumed on farms where produced, or fed to calves, and milk marketed in the form of butterfat or farm butter. The United States estimates of milk sold at wholesale are distributed by States according to the ratio of milk production in the various States, as determined by number of cows and production per cow, in the current month to the same month in the preceding year, this ratio being applied to sales in the same month of the preceding year.

Sales of milk retailed by farmers are fairly constant from year to year, and at the beginning of each calendar year an estimate is made of probable quantities of milk to be retailed in each State during the year. These annual estimates of sales are then distributed equally by days, the monthly sales varying according to the number of days in the month. Sales of the various dairy products are then valued by mid-month prices received by farmers.

Sales of poultry and eggs

The monthly estimates of income from poultry and eggs include receipts from sales of chickens and chicken eggs, and turkeys, ducks, and geese. For the period 1936-39 the estimated annual sales of eggs were distributed by months according to eggs laid per farm flock as of the first of the month. Beginning with 1940, monthly sales of eggs are estimated by applying the ratio between production in the current month and in the same month of the preceding year to sales in the corresponding month of the preceding year.

The estimated annual quantities of chickens sold for the period 1936-39 were distributed by months according to a seasonal trend of marketings determined from the month-to-month change in the number of chickens in farm flocks, the number of chickens hatched during the year, and market receipts of poultry during the period 1935-37. This seasonal distribution of sales represents the average number of chickens moving to market during the years studied, and is available only by major geographic regions, the same seasonal distribution of marketings being used for all States within the region. The current estimates of chickens sold are based on the number of chickens in farm flocks at the beginning of the year, chickens hatched during the year, and receipts of poultry at principal markets. The estimated sales for the United States are then distributed by States, during the early months of the year, on the basis of the number of chickens in farm flocks at the beginning of the year. As the new crop of chickens begins to move to market, the number of chickens hatched is also taken into account in distributing monthly sales between the various States.

The estimated annual quantities of turkeys sold during the years 1936-39 were distributed by months from information collected from crop reporters at the end of the crop marketing season. The current estimates of sales of turkeys are based on information from crop reporters on the quantity of turkeys available for sale at the beginning of the marketing season and the proportion they expect to sell each month.

In the estimates of income from poultry, allowance has been made for the income from ducks and geese. As no data are available currently on the quantity of ducks and geese sold or prices received by producers, the adjustment for income from ducks and geese was based on census data on the value of ducks and geese raised. A comparison between value of ducks and geese raised in 1929 with the value of chickens and turkeys raised in that year was used to determine the relationship between income from ducks and geese and from other poultry. This same relationship was used for all years from 1936 through 1939, and the income from ducks and geese was distributed by States according to the proportion of the total value of ducks and geese raised in each State in 1929 to the value for the United States. The income for each State has been distributed by months from data available on the movement of ducks and geese into cold storage and on the movement from principal commercial producing areas.

Income from wool is estimated from the total amount of wool shorn during the year, and a seasonal distribution of marketings is determined from inquiries of livestock reporters in principal wool-producing States. The

State estimates of the amount of wool to be shorn in the current year are computed from the number of stock sheep on farms on January 1 and the average weight of fleece.

Income from miscellaneous livestock products includes income from mohair, horses, mules, and honey. The annual estimates of income from these commodities were distributed by months for each State during the period 1936-39 on information obtained from crop reporters, State statisticians, and receipts of the principal markets. A comparison of the income from these commodities with income from other livestock and livestock products in each State for the period 1936-39 is used in estimating the current income from these products.

Government payments

Government payments to farmers include payments directly to farmers and to county associations on the Soil Conservation Program, Sugar Act payments, and price parity payments. They also include a small amount of benefit payments to farmers after January 1, 1936 and a small amount of payments from the pooling of cotton from 1934 to 1936. They do not include payments for purchases of commodities by the Surplus Commodities Corporation, as these purchases are included in estimated sales, and the income from these products is measured in the estimated sales and prices received by farmers. The payments received by farmers on commodities placed under loan are included in the income from the different commodities rather than in Government payments.

Government payments to farmers are measured by checks written for specific payments during the month. Consequently, checks returned uncanceled are recorded as minus Government payments, and in a few States in some months the amount of returned checks exceeds the amount of payments, so that Government payments are recorded as a minus quantity. This was particularly true in February 1936, when no payments were made during the month but checks that had been written in previous months were returned.

Monthly estimates of cash farm income by States

The monthly estimates of cash farm income by States in January 1936 to December 1939 given in the following tables show the income from crops, income from livestock and livestock products, total income from farm marketings, Government payments to farmers, and total income including Government payments. Because of the preliminary nature of the estimated quantities sold in current months, the monthly estimates of income for 1938 and 1939 are subject to revision when data on crop-year sales and monthly marketings have been collected and summarized. In the future, the estimates for the previous year will be revised as soon as possible after the end of the crop-marketing season for most crops.

There are many of the people of the world who are not
satisfied with the present state of things and who are
looking for a better one.

There are many of the people of the world who are not
satisfied with the present state of things and who are
looking for a better one. They are looking for a better
state of things, a better world, a better life.
